# SOP-配置 VSCode 远程开发

### 安装 Remote - SSH 插件

如果要外网远程开发的话,需要用修改ProxyCommand nc -x SSHost:Port %h %p

1. 配置 ~/. ssh/config

```
Host lab99
HostName 10.8.0.99

Host lab137
HostName 10.8.0.137

Host lab138
HostName 10.8.0.138

Host lab99 lab137 lab138
ProxyCommand nc -x SSHost:Port %h %p
User xg
```

2. 用 lab138 做开发机

ssh-copy-id -i ~/.ssh/id\_ed25519.pub lab138

- 3. 在 本地的 VSCode 安装 Remote SSH 插件
- 4. 按F1运行Remote-SSH: Open SSH Host...命令

- 5. 输入 lab138
- 6. 打开终端输入

code ~/cqf/xgateway

#### 如果要用公司仓库newgitlab的话

1. 生成一个远程开发机用的SSH Key

```
ssh-keygen -t ed25519 -C ""
```

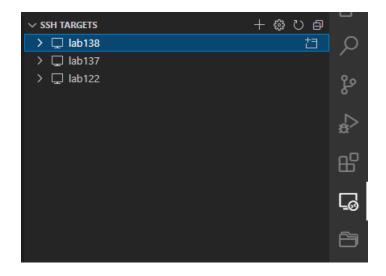

2. 修改SSH配置

```
code ~/.ssh/config
```

```
Host newgitlab.com
User git
Hostname newgitlab.com
IdentityFile ~/.ssh/<SSH Key>
```

3. 把公钥添加到newgitlab账号上

另外,可以在Remote Explorer里面把服务器加上方便后面快速打开(可选)

如果报 wget failed 之类的错误,可以在服务器上手动安装VSCode Server

```
wget\ https://update.code.visualstudio.com/commit:c722ca6c7eed3d7987c0d5c3df5c45f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-linux-x64f6b15e77d1/server-li

```

## Rust和相关开发插件

把以下插件安装在远程服务器上:

- 1. rust-analyzer
- 2. Even Better TOML 3. YAML

## Markdown插件

把以下插件安装在远程服务器上:

- Markdown All in One
   Markdown Preview Enhanced
